

# **Orthopedic Examination of the Spine, Pelvis, and Extremities, DX 611 Clinical Assessment Protocol**

James J. Lehman, DC, MBA, DABCO  
University of Bridgeport College of Chiropractic

# DIAGNOSIS 611

## Orthopedics

- This lecture and laboratory course introduces students to the procedures necessary to examine the neuromusculoskeletal system. Normal and abnormal findings are presented and discussed. An emphasis is placed on a student's understanding of clinical anatomy and interpretation of positive tests and signs.  
*2 lecture hours, 4 laboratory hours, 4 semester hours*

# Life-Long Learners

# Orthopedics

## Clinical assessment protocol

- Patient history
- Inspection and observation
- Palpation
- Range of motion
- Orthopaedic and neurologic testing
- Diagnostic imaging
- Functional testing

# Orthopedics

## Clinical assessment protocol

- **Subjective**
- **Objective**
- **Assessment**
- **Plan**

Patient history  
Objective findings  
Diagnoses  
Further testing or  
treatment

# Orthopedics

## Clinical assessment protocol

### **Closed-Ended History**

Patient completes an intake form with direct and pointed questions.

### **Open-Ended History**

An open dialogue to discuss the patient's condition

# Closed-Ended History

## Completion of an intake form by patient

# Open-Ended History

Doctor records medical history

# Orthopedics

## OPQRST Mnemonic

- **O**nset of complaint
- **P**rovoking or palliative concerns
- **Q**uality of pain
- **R**adiating to a particular area or referred
- **S**ite and severity of complaint
- **T**ime frame of complaint

# Orthopedics

## Observation

- General appearance
- Functional status
- Body type
- Postural deviations

# General Appearance

**Obese, middle-aged, Caucasian female**

# Functional Status

## Athletically active adults

# **Body Type and General Appearance**

**Young, healthy appearing, mesomorphic, male Caucasian**

# Body Type

## Mesomorph

# Body Type

## Endomorph

# Body Type

## Ectomorph

# Postural Deviations

**Young, healthy appearing, mesomorphic, black female with scoliosis**

# Orthopedics

## Observation

- Postural deviations
  - Gait
  - Muscle guarding
  - Compensatory or substitutive movements
  - Assistive devices for functional status

# Posture Deviations

Antalgic posture with limping gait

# Orthopedics

## Inspection

- Skin
- Subcutaneous soft tissue
- Bony structure

# Orthopedics

## Skin Inspection

- Contusions or cicatrix formations
- Evidence of trauma or surgical intervention
- Changes in color or texture
- Open wounds

# Skin Inspection

**Post-surgical thoracic spine cicatrix formations**

# Skin Inspection

Contusions from “Kinetic Impact Munitions”

# Orthopedics

## Subcutaneous Inspection

- Inflammation and swelling or atrophy
  - Compare for bilateral symmetry
  - Circumferential mensuration of extremities

# Orthopedics

## Subcutaneous Inspection

- Increase in size
  - Edema
  - Articular effusion
  - Muscle hypertrophy or other
  - Note nodules, lymph nodes, or cysts

# Subcutaneous Inspection

## Pitting Edema

# Subcutaneous Inspection

## Articular effusion

# Orthopedics

## Bony Structure Inspection

### Evaluate

- Functional abnormality
  - Gait deviation
  - Altered range of motion

# Orthopedics

## Bony Structure Inspection

### Evaluate

#### 1. Spine

- Scoliosis
- Pelvic tilt or obliquity
- Shoulder height

# Bony Structure Inspection

## Scoliosis examination

# Orthopedics

## Bony Structure Inspection

- Note and possibly measure extremity malformations
  - Traumatic
    - Healed Colles' fracture with residual angulation
  - Congenital
    - Genu varus or Genu valgus

# Colles Fracture

# Bony Structure Inspection

## Colles Fracture

# Wrist Fractures

Flexion fracture of the radius (Smith's fracture)

Extension fracture of the radius (Colles' fracture)

# Orthopedics

## Bony Structure Inspection

- *All bony structures should be visually assessed for abnormalities and documented*

# Orthopedics

## Skin palpation

Palpation with light touch

### 1. Temperature

1. Elevated with inflammation
2. Lowered with vascular deficiency

### 2. Mobility

1. Post-traumatic or post-surgical adhesions

# Orthopedics

## Subcutaneous soft tissue palpation

### Palpation with increased pressure

1. Consists of fat, fascia, tendons, muscles, ligaments, joint capsules, nerves, and blood vessels
2. Note tenderness
3. Determine tenderness and grade it

# Orthopedics

## Tenderness Grading Scale

- Grade I
  - Grade II
  - Grade III
  - Grade IV
- Pain
  - Pain and winces
  - Wincing and withdraws
  - Does not allow palpation

# Orthopedics

## Differentiate types of edema

1. Blood
  2. Synovial fluid
1. Immediate post-traumatic warm and hard
  2. 8-24 hours post-traumatic, boggy or spongy

# Orthopedics

## Differentiate types of edema

3. Callus

4. Chronic swelling

5. Acute

6. Bone

7. Pitting edema

3. Tough and dry swelling

4. Thickened or leathery

5. Soft and fluctuating edema

6. Hard

7. Thick and slow moving edema

# Orthopedics

## Pulse palpation

- Thoracic outlet syndrome
- Arterial insufficiency

# Orthopedics

## Palpation of bony structures

- Alignment problems
  - Dislocations
  - Luxations
  - Subluxations
  - Fractures

# Orthopedics

## Palpation of bony structures

- Tenderness is a major finding
  - Identify tendons and ligaments
  - Sprain, strain, or fracture

# Orthopedics

## Palpation of bony structures

- Bony enlargements
  - Healing of fractures
  - Degenerative joint disease

# Orthopedics

## Range of Motion

1. Passive
2. Active
3. Resisted

# Orthopedics

## Passive Range of Motion

### Examiner moves the body part

1. Note normal, increased, or decreased ROM and in which planes
2. Note pain
  - Ipsilateral pain = capsular or ligamentous lesion
  - Contralateral pain = Muscular lesion

# Passive Range of Motion

# Orthopedics

## Active Range of Motion

### Patient moves body part

- Tests muscle integrity and nerve supply
- Compare ROM
- Correlate pain with movement
- Note crepitus (crackling)

# Active Range of Motion

# Orthopedics

## Active Range of Motion

- Crepitus is crackling sound
- Indicates
  - Roughening of joint
  - Increased friction between tendon and sheath caused by edema or roughening

# Orthopedics

## Active Range of Motion

- You will be required to utilize goniometer but not an inclinometer
- Medical conditions involving impairment ratings or disability determinations require specific mensuration

# Orthopedics

## Resisted Range of Motion

- Examiner resists patient movement
- Assesses musculotendinous and neurologic structures
- Primarily used to test neurologic function

# Resisted Range of Motion

# Orthopedics

## Resisted Range of Motion

- Musculotendinous injuries are more painful than weak
- Neurologic lesions are more weak than painful

# Orthopedics

## Six Ranges of Motion and Pain Variations

1. Normal mobility with no pain
2. Normal mobility with pain elicited
3. Hypomobility with no pain
4. Hypomobility with pain elicited
5. Hypermobility with no pain
6. Hypermobility with pain elicited

# Orthopedics

## Hard End Feel Evaluation

### Normal Physiological

- Abrupt hard to stop movement when bone contacts bone
- Passive elbow extension
- Olecranon process contracts the olecranon fossa

# Orthopedics

## Hard End Feel Evaluation

### Abnormal Pathologic

- Abrupt stopping movement before normal expected passive movements
- Cervical flexion hard end feel due to severe DJD

# Orthopedics

## Soft End Feel Evaluation

### Normal

- When 2 body surfaces come together, a soft compression of tissue is felt
- Passive elbow flexion
- Anterior aspect of the forearm approximates the biceps muscle

# Orthopedics

## Soft End Feel Evaluation

### Abnormal

- A soft boggy sensation resulting from synovitis or soft tissue edema
- Ligamentous sprain

# Orthopedics

## Firm End Feel Evaluation

### Normal

- A firm or spongy sensation that has some give when a muscle, ligament, or tendon is stretched
- Passive wrist flexion, passive external shoulder rotation

# Orthopedics

## Firm End Feel Evaluation

### Abnormal

- A firm springy sensation to movement with a slight amount of give in capsular joints
- Frozen shoulder or adhesive capsulitis

# Orthopedics

Springy, Block End Feel Evaluation

## Abnormal Pathologic End Feels

- Rebound effect with limited motion; usually in joints with a meniscus.
- Torn meniscus

# Orthopedics

## Empty End Feel Evaluation

### Abnormal Pathologic End Feel

- An empty feel in a joint with severe pain when passively moved. The movement cannot be performed because of the pain.
- Fracture, subacromial bursitis, neoplasm, joint inflammation.

# Orthopedics

**Special physical, orthopaedic, and neurologic testing**

- Provocative maneuvers
- Place functional stress on isolated tissue structures
- Reveal pathologies and biomechanical lesions
- Multiple tests are necessary to confirm a diagnosis

# Orthopedics

**Special physical, orthopaedic, and neurologic testing**

- *“Primum non nocere”*
- *First do no harm*
- Prior to performing provocative maneuvers it is essential that you rule out contraindications to such procedures.

# Hippocrates

## Epidemics, Book 1, Section XI

- *"Declare the past, diagnose the present, foretell the future; practice these acts. As to diseases, make a habit of two things — to help, or at least to do no harm."*

# Hippocrates

## Father of Chiropractic Medicine

# Orthopedics

**Special physical, orthopaedic, and neurologic testing**

- Rust's sign
- Post-traumatic holding of head with both hands in order to support the weight of the head on the cervical spine.
- Supine patient will grasp back of head while attempting to rise into a seated position

# Rust's Sign

**Do not perform orthopedic tests or spinal manipulation**

OrthoNotes

# Orthopedics

**Special physical, orthopaedic, and neurologic testing**

- Rust's sign indicates a probable upper cervical spine instability
- Severe upper cervical spine injury to muscle, ligament, disc, and osseous structures
- Rule out fracture, dislocation, severe strain or sprain

# Orthopedics

**Special physical, orthopaedic, and neurologic testing**

- Rust's sign
- Patient is attempting to stabilize the head with slight traction and reduce pain
- Patient presents guarded movements
- Imaging studies must proceed any provocative testing

# Orthopedics

**Special physical, orthopaedic, and neurologic testing**

- Sensitivity/Reliability Scale
- Based upon the biomechanics of the movement to isolate the affected structures

# Orthopedics

**Special physical, orthopaedic, and neurologic testing**

- Sensitivity is the proportion of true positives that are correctly identified by the test.
- Specificity is the proportion of true negatives that are correctly identified by the test.

# Sensitivity and Specificity

Instability (Rust's sign)

	Abnormal	Normal	Total
■ VFS (+)		(-)	
■ Abnormal(+)	90	10	100
■ Normal(-)	20	80	100
■ Total	110	90	200

# Sensitivity and Specificity

- The proportions of these two groups that were correctly diagnosed by the sign were

$90/110=0.82$  (sensitivity) and

$80/90=0.89$  (specificity)

# Predictive Values

"Given a positive (or negative) test result, what is the new probability of instability?"

# Predictive Values

**Positive predictive value** = probability of instability among patients with a positive test

# Predictive Values

**Negative predictive value** = probability of no instability among patients with a negative test

# Predictive Values

<http://www.poems.msu.edu/EBM/Diagnosis/PredictiveValues.htm>

	With instability	Without stability
Test is Positive	a(90)	b(10)
Test is Negative	c(20)	d(90)

# Predictive Values

**We can now define positive and negative predictive value**

- Positive predictive value =  $a / (a+b)$
- Negative predictive value =  $d / (c+d)$
- Post-test probability of instability given a positive test =  $a / (a+b)$
- Post-test probability of instability given a negative test =  $c / (c+d)$

# Predictive Values

**We can now define positive and negative predictive value**

- Positive predictive value =  $90 / (90+10) = 90\%$
- Negative predictive value =  $90 / (20+90) = 82\%$
- Post-test probability of instability given a positive test =  $90 / (90+10) = 90\%$
- Post-test probability of instability given a negative test =  $20 / (20+90) = 18\%$

# Diagnostic Imaging Radiographic Examination

- *Bone is best-seen tissue on plain film radiography*

# Standard Plain Film Radiograph

# Computed Tomography

- *CT is best used for bone detail and demonstration of calcifications.*
- *Intervertebral disc defects may also be visualized on CT, but not as well as MRI*

# CT Scan

# Magnetic Resonance Imaging

- *MRI is invaluable in contrasting soft tissue structures in many planes without the use of ionizing radiation*
- *It poorly demonstrates bone density detail or calcifications; this is the advantage of CT.*

# MRI

# Myelography

- Water-soluble contrast medium is injected into the subarachnoid space
- Standard radiographic exposure is used to evaluate any defects of the spinal canal
- Spinal stenosis, spinal cord lesions, and dural tears

# Skeletal Scintigraphy or Bone Scans

- Intravenous radiopharmaceutical, technetium-99m
- Attracts osteoblastic activity, such as healing fractures
- Best suited for undetectable fractures and arthropathies (DJD, osteomyelitis, bony dysplasias, primary bone tumors, and METS)

# Clinical Assessment Protocol

## Final Slide
